
Transpower completes Clutha to Upper Waitaki Lines project

Transpower has recently completed its project to duplex the conductors on the 142 kilometre long southern section of the Roxburgh to Islington A 220 kV transmission line which, along with related work, has substantially increased the northward capacity of this part of the transmission network.

The upgrade, undertaken through difficult terrain and in challenging weather conditions, provides transmission capacity for the possible closure of the Tiwai Point aluminium smelter or for new renewable generation in the area.

Greenwood Roche again assisted Transpower with landowner negotiations along the route of the line, including preparing the agreements, negotiating terms with landowner representatives and completing easement documentation.
